

Reducing Energy Use and Costs

There are glass and film solutions that reduce a building's heat gain and heat loss, saving you money on your energy bill.

Did you know that in summer 87% of heat gain in a building is via windows? How about the fact that in winter those same windows allow 49% of your building's heat loss.

By using the right glass and/or film solutions we can prevent up to 70% of heat transfer, reducing your air conditioning costs.

A wide range of glass and film solutions are available that reduce the climate control bill for your premises.

- Low E glass reflects direct solar energy as well as reflected heat.
- Double glazing or insulated glass units provide increased thermal insulation.
- Various laminates applied during the production process can eliminate up to 99% of harmful UV rays.
- There are also a wide range of solar control films available.

The Federal Government has instituted a Carbon Pollution Reduction Scheme. It may not affect you today, but it's time to prepare for tomorrow. Market experts predict the Scheme will cause energy prices to increase by 15-50%.

Act now to offset future costs. Express Glass has information on the right energy efficient solutions for you.

To talk to someone about how Express Glass can help you with your emergency glass and glazing, call Mark Jennings on 0438 574 277 or email markj@expressglass.com.au.
